

Solutions for Public Sector and Utilities

Bridging the gap
between the
map and
financials

Microsoft
GOLD CERTIFIED
Partner

The ability to use geographic information as a framework to integrate and manage data across multiple areas is the foundation of GIS. A visual representation of boundaries, structures, utility lines and assets, among other elements, provides a robust, flexible and potentially massive digital repository of usable data. When GIS systems are implemented and the values showcased, it becomes clear what is meant by the phrase, “it’s all about the map!”

Organizations using GIS apply it to applications ranging from the physical mapping of assets to storing detailed information about the attributes that make up those assets. When a GIS solution is applied this way, facilities and work order management reaches a whole new level of clarity. This is a great gain of efficiency, but falls short in most instances due to a single missing link – the GIS system is not connected to the financials.

Bridging the gap between the map and financials

WennSoft adds that missing link. WennSoft develops software solutions for public and private organizations in need of detailed cost tracking, scheduling, facilities management, fleet management, asset tracking and construction management. All of these elements are then tied to Microsoft financials. The integration between these business applications and the financials is the cornerstone of our solutions. WennSoft solutions also are able to extend this integration to the “map” – serving as a bridge between applications and delivering a truly complete solution.

WennSoft solutions integrate the visual information available from ArcGIS with other areas in an organization through the work order system and Microsoft Dynamics™ GP. The system also provides access to detailed information from the field. For many departments, using spatial information supplied by GIS while scheduling work cuts down on errors and eliminates multiple entries of the same data – improving operational efficiencies and enhancing customer service.

Bridging the gap (continued)...

The WennSoft solution uses ArcGIS to supply work orders with information on location, history, affected residents, distribution network, shutoff, disconnect and assets. Graphic maps, utility locations, layers and history can be attached to work orders and leveraged by the crews in the field. This wealth of information speeds up response and shortens the time it takes to complete an order.

When ArcGIS and WennSoft work order management systems are fully integrated with the cost and asset information in Microsoft Dynamics financials, information flows between departments eliminating redundant efforts and reducing labor costs. In addition, the system will track costs by work order and system to update finance records. This cost-based work order system is completely integrated with purchasing, inventory, fixed assets, payroll, and financials – allowing better cost tracking, future budgeting, more informed repair or replace decisions and improved cost control.

With this combination of products, the finance department can easily access the information it needs to report to other departments; and officials and department heads can get the detailed cost tracking needed for reimbursements by state and federal agencies such as the Federal Emergency Management Agency.

About Wennsoft

Built on Microsoft Dynamics GP financials, WennSoft solutions are well suited for the multiple divisions typically found within a government organization. Scalable to work well for everything from public works to parks and recreation to facilities management and large development and improvement projects, WennSoft solutions enhance efficiency, track information, control costs and deliver services at the highest level.

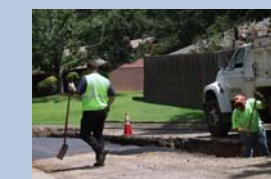

- An efficient way to transfer information, maps and data using field resources
- The ability to capture cost detail and accrual throughout the life of a work order or project

WennSoft solutions for the Public Sector include:

- Citizen Requests
- Facilities Management
- Work Order Management
- Fleet Management
- Asset Management
- Construction Services

For more information about WennSoft Solutions, please visit www.wennsoft.com/gov

WennSoft solutions have been designed to address a wide range of business issues commonly encountered in the public sector such as:

- An efficient means of capturing constituent requests and initiating a work order based on that request when applicable
- A single integrated system that provides cross-department collaboration with a single point of entry for data –reducing errors and increasing efficiency
- The capability to exchange information with other departments, without losing any history

WennSoft Field Mobile Application Extension – MobileTEC

When managing information in the field, many public departments and utilities are challenged by massive growth, older infrastructure, complex schedules and a widely distributed mobile workforce. The WennSoft Field Mobile Application, MobileTEC, meets these challenges by combining the rich functionality of the WennSoft work order management system with the information captured by your ArcGIS database and extends both to the work orders used by field crews. When field crews are supplied with PDAs, laptops or tablet/slate PCs, detailed costs can be sent back to the core system for use by finance. Reporting, reimbursement justification and budgeting are all enhanced and errors eliminated. MobileTEC can help you increase efficiency by reducing response time and accurately collecting the cost, time and equipment used on any work order.

Contact us to find out how WennsSoft MobileTEC can increase your ROI by bridging the gap between your core financials and your ArcGIS – let us help you build a truly complete solution.
